

Week 1 UI Audit — Reopened Again, Still Closed

Dyuthi T G • 2026-09-15 • checking the Aug 26 audit is still closed, two weeks later

I closed this list once already on Sep 14. Today I opened it again on purpose, because a lot of real code has landed since then — a whole new Campaign Detail page, the campaign wizard now picks a real account, and the nav itself got renamed and then simplified. Closing something once doesn't mean it stays closed while the app keeps moving, so I re-checked every line against the app as it runs right now, not against my notes from last time. All seven closed items still hold. The two still open are still open, for the same reason as before. And while re-checking the new Campaign Detail page for keyboard access, I found a real bug — not on Aug 26's list, because the page didn't exist yet — and fixed it.

Every line from Aug 26, checked again

Sev	Finding	Status	Note
Blocks	Suggestion engine returns nothing for 2 of 6 warm-up stages, blames 'connect'	Still closed	Checked live again today, unchanged since Aug 31
Blocks	No way to see repeats across queued suggestions before approving	Still closed	Checked live again today, unchanged since Aug 31
Blocks	'Never contact' fires with zero confirmation, beside routine buttons	Still closed	Checked live again today, unchanged since Aug 31
Blocks	'Today's activity' shows a made-up schedule labeled as real	Still closed	That panel is still gone; Warm-up still shows the real numbers
Blocks	Agents page renders blank — data loads, the page never shows it	Still closed	Left the page open across a live poll cycle again today with the new sub-tab nav sitting in front of it — nothing went invisible. Confirmed the fix survives the nav being rebuilt around it, not just the original page
Slows	Connecting an account means opening DevTools and copying raw cookies	Still open	Same reason as Sep 14: needs a real LinkedIn login flow, a product/API decision, not a frontend fix. Flagged for Hemang, not silently dropped
Slows	No screen shows the people actually imported for a target profile	Still open	Same reason as Sep 14: needs a backend endpoint that counts/lists imported people. Nothing new to wire the frontend to yet
Looks bad	Agents and Campaigns are a different app behind the same menu bar	Still closed	Both still share the one dark/purple look; Campaigns is still one tap away

Sev	Finding	Status	Note
Looks bad	Phone menu loses its labels and the account name disappears	Still closed	Labels still never hide, even now that the nav has fewer, longer tab names than it did on Sep 14 — checked that specifically, since longer labels were the more likely way for this to quietly break again

Same seven closed, same two open, same two reasons. Nothing on this list quietly broke while the app changed underneath it.

A NEW KEYBOARD BUG, FOUND WHILE CHECKING THE NEW CAMPAIGN DETAIL PAGE

The Campaign Detail page didn't exist on Aug 26, so it was never on the original list — but today's brief says keyboard states everywhere, so I tabbed through it with a real keyboard anyway. The Start/Pause campaign button took **two** Tab presses to reach, not one: the first landed on an invisible, empty stop with a focus ring around nothing, and only the second reached the real button. Same thing on the “Social Bot” logo in the corner of every page. Root cause: wrapping a button in a plain animated box (to make it scale slightly on tap) makes that box its own keyboard stop, on every single page that does it, sitting right in front of the actual button.

Fixed two ways depending on what the animated box was wrapping: the logo box wraps plain text with no action of its own, so it's told not to take keyboard focus (the link around it already does). The Start/Pause button box wraps a real button with a real action, so instead I made the animation apply straight to the button itself, and deleted the extra wrapping box entirely — one element, one stop, one ring. Checked the rest of the app for the same pattern: everywhere else that taps-to-scale, the animated element already is the button, not a box around one, so this was the only place it happened.

One real Tab press from “Back to Campaigns” lands here now — on the actual button, not an empty box in front of it.

The responsive pass, including everything new since Sep 14

Checked at 860px and 540px again, plus the new Campaign Detail page and the wizard's account-picking step, neither of which existed for the last pass. The overview page still fits the whole top nav's worth of buttons at 860px and still scrolls sideways with a fade hint at 540px, exactly like Sep 14 — the mechanism that fixed the original phone-nav finding still works, it just has different labels on it now.

Overview at 860px (left) and 540px (right) — same account, same real data, both widths.

The new Campaign Detail page, checked with a real campaign I created through the actual API — and then with a deliberately very long campaign name, the same kind of stress test that caught real wrapping bugs in earlier passes:

860px with a normal name (left). 540px with a name almost 90 characters long (right) — it truncates with an ellipsis, the badge and button drop to their own lines, and nothing overlaps or breaks.

The nav got simpler today, and I checked it holds up

Partway through today's check the top nav changed — eight tabs became five, with Targeting and Campaigns folded into one tab, and Accounts, Warm-up and Agents folded into another, each with its own row of sub-tabs underneath. That wasn't something I did; it's a real, in-progress improvement to the same phone-nav crowding this audit has been tracking since Aug 26, and it's a good direction — fewer top-level tabs is exactly what a narrow screen needs. I made sure it actually works rather than just trusting it: it type-checks clean, every merged page routes correctly, and the sub-tab strips get the same 44px touch targets and the same never-hide-the-label rule as the top nav.

The five-tab nav at 540px (left) — still fully labeled, still scrolls to reach the last one. LinkedIn Accounts, Warm-up and Agents sharing one tab with a sub-tab strip underneath (middle). The campaign wizard's real account picker, added Sep 14, still clean at 540px (right).

The other two things asked for today

Loading and transition polish, reduced motion respected. This was already in place app-wide as of Sep 14 (MotionConfig at the root, plus the two GSAP pages checking prefers-reduced-motion by hand). I didn't need to add anything new — I needed to prove it still holds now that there's more to it. I left the Agents page open through a live poll cycle again, this time reached through the new sub-tab nav instead of a direct link, and nothing went invisible. The new Campaign Detail page was built Sep 14 already following the same pattern (its own prefersReducedMotion check gating the Start/Pause button's animation) — I checked it does the same thing everywhere else in the app, not something that quietly only half-applies to new pages.

Keyboard and focus states everywhere. Covered above — the one real gap was the two phantom tab stops, both now fixed and verified with real Tab presses, not just read from the code. Every other interactive element I checked today (the wizard's account checkboxes, the sub-tab strips, the Verify/disconnect icon buttons on the Accounts page) already had a working keyboard path and a visible focus ring, so nothing else needed changing.

Method: ran the real app on my own machine (Vite dev server + a local SQLite backend with the dev auth bypass, not mocked), created a real test account and a real test campaign through the actual API — not hand-written fixtures — clicked through every page at both widths, tabbed through with a real keyboard, and left pages open across live data polls to check nothing breaks over time. The two items still open from Aug 26 need backend work or a product call I still don't have; everything else, including everything built since Sep 14, is checked and holding.
