

Ship-today task map: the four rules, mapped to this repo

2026-09-16 • first day of the Section 6 pilot window

This is not a new plan. Everything below already exists in **Week3_And_Go_Live_Checklist.pdf** (the Section 4 owner list and the Section 6 blast-radius plan). What this page does is take today's four rules and point each one at the exact file, script, or checklist line that satisfies it, and say plainly what the repo shows is actually done this morning versus still open.

1. The four rules, and where each one lives

Rule	Where it lives in this repo
Get the account and blast radius agreed in writing before you start.	Week3_And_Go_Live_Checklist.pdf, Section 6 (the plan) and Section 4, row "Harshil: read and sign off...". The new §0 in GO_LIVE_DAY_LOG_TEMPLATE.md is where the actual written yes gets pasted in — not a checklist checkbox, the real reply.
Approve at least twenty real items live.	The real review queue: frontend Approvals.tsx against the backend review-queue API, on the account created per Section 4 row 1. Logged item-by-item in GO_LIVE_DAY_LOG_TEMPLATE.md §2. This is the one rule on this page nobody but the human at the keyboard can execute — see Section 2 below.
Log every hesitation, not just every error.	New: nothing in the repo captured this before today. GO_LIVE_DAY_LOG_TEMPLATE.md §3 is a plain table — item #, what caused the pause, how long, what would remove it — filled in live, not reconstructed from memory afterward.
Ship today: dry-run log with the issue list, and written approval on record.	Same shapes the repo already uses: the transcript style of staging_run/transcript.md for the run narrative, the entry style of BREAK_LIST.md for each issue, and §0 / §6 of GO_LIVE_DAY_LOG_TEMPLATE.md for the written sign-off, dated and named.

2. The one rule I can't run for you

"Approve at least twenty real items live" only means something if the approval is a real human, logged into the real account, making a real judgment call — that's the entire reason Section 6 requires 100% human review with no exceptions for "obviously fine" ones. An assistant clicking approve on your behalf would be exactly the thing the rule exists to prevent, so I'm not going to simulate it or write a log that implies it happened when it didn't. What I've done instead is get everything around that step ready: the log template, the status check below, and this map — so the only thing left for the session itself is the twenty approvals.

3. Where the Section 4 checklist actually stands this morning

Checked against the repo, not against memory of the plan. “No evidence in repo” means exactly that — it may well be done in an account or environment I can't see from here; it just isn't provable from what's checked in.

Owner	What	Status this morning
Dyuthi	Create one disposable LinkedIn account	No evidence in repo either way.
Hemang	Real ENCRYPTION_KEY set; /healthz credentials_encryption: ok	backend/.env.example still has the placeholder value; no confirmation found.
Deep	Redis stood up; /healthz redis: ok	docker-compose.yml wires REDIS_URL by default; no run confirmation found.
Dyuthi	validate_account.py: all four preflight checks green	No run output found in repo.
Dyuthi	Account enrolled in warm-up at stage zero	No evidence in repo either way.
Harshil	Written sign-off on the Section 6 blast-radius plan	Not found — this is the \$0 line in the new log template.
Dyuthi	First single comment sent live, watched end to end	Not yet — today's session.
Dyuthi	Daily session-validity check on the account	N/A until the account exists.
Kethan	Sit through one live approval session	Not yet — today's session.
Harshil & Deep	Go/no-go past one burner account	Scheduled for Sep 18, after today's data.

Recommendation: don't run the twenty live approvals until the three infra rows (ENCRYPTION_KEY, Redis, validate_account.py) are actually green and Harshil's sign-off is on record. Section 6 exists precisely so speed doesn't quietly replace those checks.

4. What's ready to use right now

- **docs/templates/GO_LIVE_DAY_LOG_TEMPLATE.md** — one file covering written agreement, preflight, the twenty-item log, the hesitation log, the issue list, and the go/no-go input. Copy it, fill it in live.
- **BREAK_LIST.md** — the existing entry format (severity, what happened, evidence, fixed today or not) for anything today's session breaks.
- **staging_run/transcript.md** — the existing narrative shape for a run log, if today's dry-run portion is worth recording the same way.

- **scripts/validate_account.py** — the one command for connect-and-preflight; read-only until all four checks are green.

Nothing in this document is itself the written approval — it's the map to where that approval, and today's twenty items, get recorded once the session actually runs.
