

Operator UI Audit

Dyuthi T G • 2026-08-26 • every screen, used like an operator, checked on desktop and phone

I clicked through the real dashboard the way an operator would — generated a real review queue, approved and rejected real items, connected an account, and checked the whole thing on a phone. Below is what I found, worst first.

THE BIGGEST FINDING — SOMETHING MISSING, NOT SOMETHING BROKEN

Going in, the assumption was that there's no screen at all where a human checks the bot's work. That's not quite right. The review screen (Approvals) is real — it works, and nothing sends without a click. What it's actually missing: **there's no way to see more than one item at a time**. No comparison, no "these three look identical" warning. Just one card, then the next. When 9 of 10 queued comments turned out to be almost the exact same sentence with the name swapped, there was no way to notice that until several cards had already been clicked past.

A review screen that can't catch repeats isn't a smaller version of human review — it's the appearance of human review without the substance.

What I found

Blocks work	Slows work	Looks bad
4	3	3

"Blocks work" always outranks "slows work," which always outranks "looks bad" — no matter how visually loud a finding is.

BLOCKS WORK

“Suggest who to contact” returns nothing for 9 of the program's first 21 days — and blames the wrong thing

Every account ramps through six stages before it can connect or message. Clicking the queue's only button while an account is in the Commenting stage — where comments are supposed to work — returns zero suggestions out of 24 available people, and blames **'connect'**, an action nobody tried to use. The generator checks connect/message first and quits before it ever reaches the comment logic that would have worked.

24 candidate people were on the account, all scored 100 — none reached the operator.

BLOCKS WORK

Ten queued comments, nine of them the same template

Once suggestions did generate, nine of ten used the identical skeleton: “This matches what I keep seeing, [name] — the hard part is usually getting everyone to agree on it first. How did you handle that?” The queue shows one card at a time, so nothing on this screen would tell an operator this was happening.

Same pattern the Aug 21 comment-quality audit flagged at 43 of 58 — now visible live in the queue, with nothing built to catch it.

BLOCKS WORK

“Never contact” is one un-confirmed tap, right next to routine buttons

Tapping Never Contact permanently suppresses a real person. It fires immediately — no dialog, no undo. It sits right beside Skip in the same row. On the phone the row wraps to two lines, landing almost exactly where a

thumb rests while scrolling one-handed.

Permanent action, zero confirmation, one thumb-width from a routine button.

BLOCKS WORK

“Today's activity” shows a made-up schedule as if it already happened

This account sent nothing today — three separate counters on the Overview page say so. The Warm-up page's “Today's activity” panel disagrees: 3 comments, 8 messages, 12 likes, 10 connects, each with a clock time, formatted exactly like a real log. It's actually a randomized hypothetical plan, and the real (all-zero) numbers are never shown on this screen at all.

10 connects, 8 messages shown here. Real total sent today, everywhere else on this account: 0.

BLOCKS WORK

The Agents page renders a blank white screen — the data is there, it's just invisible

One click from the main menu. The real data loads (5 agents, real status) but the page's own animation gets stuck before showing anything, leaving a header on an empty page. Reproduced repeatedly, not a one-off.

5 stat cards and 5 agent cards exist in the page right now — stuck invisible.

SLOWS WORK

Connecting an account means digging into browser DevTools and copying login codes by hand

The only way to link a LinkedIn account: sign in, open DevTools, find two cookie values, and paste them into the form. There's no simpler login option.

Step 2, for every single operator: open developer tools.

SLOWS WORK

No screen anywhere shows the people you've actually imported

This target list has 24 real people behind it. The card only shows the filter rules — no count, not clickable. Those 24 people are only ever visible if they later survive into a suggestion.

24 people live behind this card. Zero of them are visible here.

LOOKS BAD

Two different apps live behind the same menu bar

Every other screen shares one dark, purple-and-amber look. The Agents and Campaigns pages are white-background, generic-blue, different-font pages — visibly a different, older build. Campaigns isn't even linked from the menu; the only way in is typing the address directly.

The seam — the real product above this line, a different app below it.

LOOKS BAD

On a phone, the menu loses its labels and the account name disappears

Below tablet width, the menu drops to icons only with no names, and a 6th item gets pushed off the right edge with just a faint scrollbar as a hint. Lower on the same screen, the connected account's name vanishes entirely — just a dot, a divider, and the word “outreach,” no way to tell which account it is.

The account name is simply gone here — this is the phone view of the very first page an operator sees.

Everything, in order

Severity	Finding	Screen
Blocks	Suggestion engine returns nothing for 2 of 6 stages, blames the wrong action	Approvals
Blocks	No way to see repeats across queued suggestions before approving	Approvals
Blocks	“Never contact” — permanent, zero confirmation, beside routine buttons	Approvals
Blocks	“Today's activity” shows a made-up plan labeled as real history	Warm-up
Blocks	Page renders invisible — data loads, nothing is shown	Agents
Slows	Connecting an account requires copying raw login codes from DevTools	Accounts
Slows	No screen shows the raw list of imported people	Targeting
Looks bad	Different look entirely, and unreachable from the menu	Agents / Campaigns
Looks bad	Menu loses labels and cuts off an item; account name disappears	Overview, phone

Method: ran the real product on my own machine with real data (1 connected account, 24 imported people, a live-generated review queue), clicked through every page in the menu plus the two pages that aren't in the menu, and repeated the main screens on a 390-pixel-wide phone view. Every finding above was actually seen happening in the browser, not just read from the code.
