

# Today's ship — the bot can't go quiet without saying so

Dyuthi • 2026-09-09

The ask was three things: an account and run-status view, failure that's loud and specific instead of a red dot, and the daily cap and quiet-hours state shown so nobody mistakes the scheduler behaving correctly for a bug. Then prove it by breaking something on purpose. Here's what I did for each, where to look, and how I checked it.

## 1. The account and run-status view

This lives on the Overview page (**frontend/src/pages/Dashboard.tsx**) — it was already the screen everyone opens first, so I built into it rather than adding a second place to check. Every account card now shows, in one row: when the scheduler last touched it, whether that run was clean, today's usage against the cap for connects/messages/comments/likes, and whether quiet hours or weekend pacing is the reason it looks idle right now.

The data comes from the same **/api/v1/outreach/dashboard** endpoint the page already called (**src/api/routes/outreach.py**) — I extended it rather than standing up a new one, so there's one source of truth instead of two dashboards that can quietly disagree.

## 2. Where "last run" and "last error" actually come from

This was the part that didn't exist yet. The scheduler already tracked a global heartbeat, but nothing recorded, per account, whether its own last sweep worked. So every account now gets a mark left on it at the end of every tick, win or lose — see **src/scheduler/tick.py** calling **record\_run\_outcome** in **src/accounts/service.py**. And every place the code already changes an account's status (session rejected, LinkedIn pushed back, a re-verify) now stamps *when* that happened, not just what it changed to — that's **set\_status** in the same file. That stamp is the whole reason the screen can say "2 hours ago" instead of "at some point."

## 3. Failure is a sentence now, not a dot

Any account with a real problem — session expired, LinkedIn suspended it, LinkedIn pushed back, or its last run failed — shows up in a red banner at the very top of the Overview page, above the summary tiles. Not a status word: a full sentence naming the account and saying how long ago, plus a Reconnect link when that's the fix. Word for word what I tested against: "LinkedIn session expired for Demo User, 2 minutes ago."

#### 4. Caps and quiet hours, shown instead of implied

Each account card now has a strip of chips: how many of each action it's used today against its cap, its weekly invitation count where that applies, and — when it's true right now — a “Quiet hours” or “Weekend — reduced pace” chip that says plainly this is expected. Those two are new pure functions, `in_quiet_hours` and `is_weekend` in `src/accounts/caps.py`, read in the account's own timezone. When there's no Redis connected — like on my machine right now — the chip says “uncapped, no Redis” instead of quietly showing 0 and looking fine.

#### 5. How I checked it — broke a session on purpose

I seeded a local database with two accounts under the same identity the dev server logs in as, ran the real API and the real frontend against it, and forced one account's session to fail and its last scheduled run to error out. Then I opened the Overview page and looked, without reading a single log line.

- The banner named the account and said **2 minutes ago** — real elapsed time, not a placeholder.
- A second banner line showed the exact run failure: **“send: TransportError: rate limit hit.”**
- The account's own card carried a red “last run failed” chip alongside its caps, so the detail is still there even once you stop looking at the banner.
- The healthy account right next to it stayed green with no banner entry — so this doesn't cry wolf for accounts that are fine.

All of that on one screen, no log file involved. I also ran the backend test suite for everything this touches — 164 tests, all passing, including new ones I wrote for this: two that break a session and a scheduled run on purpose and check the dashboard reflects it, and five for the quiet-hours/weekend math across timezones.

#### 6. Where everything is

- `frontend/src/pages/Dashboard.tsx` — the banner and the per-account run-status row
- `src/api/routes/outreach.py` (dashboard) — last run, last error, caps today, quiet hours
- `src/accounts/service.py` — `set_status` and `record_run_outcome`, the two new stamps
- `src/scheduler/tick.py` — where every account gets marked at the end of its sweep
- `src/accounts/caps.py` — `in_quiet_hours` / `is_weekend`
- `tests/test_outreach_flow.py`, `tests/test_caps.py` — the break-it-on-purpose tests

Nothing here is committed or pushed yet — it's sitting on the branch, tested and checked in a real browser against a real (locally faked) LinkedIn session. Say the word and I'll commit it.
