

Week 1 UI Audit — Closed

Dyuthi T G • 2026-09-14 • reopening the Aug 26 Operator UI Audit to close it

I wrote the Aug 26 audit myself, so today I went back to it and closed the list — line by line, not just the easy ones. Seven of the nine findings are done: four of them were actually closed over the past two weeks and I confirmed each one still holds; the other three I fixed today. The two that are still open needed a decision or a backend piece I don't have yet, and I've said exactly why instead of going quiet on them. Alongside that I did the other four things asked for today: a responsive pass at 860px and 540px, keyboard and focus states everywhere, and loading/transition polish that actually turns off for anyone with reduced motion set.

Every line from Aug 26

Sev	Finding	Status	Note
Blocks	Suggestion engine returns nothing for 2 of 6 warm-up stages, blames 'connect'	Closed Aug 31	suggest.py now checks the comment path too, not just connect/message
Blocks	No way to see repeats across queued suggestions before approving	Closed Aug 31	Near-identical drafts across the queue are now detected and flagged
Blocks	'Never contact' fires with zero confirmation, beside routine buttons	Closed Aug 31	Two-tap confirm now sits between the tap and the permanent suppression
Blocks	'Today's activity' shows a made-up schedule labeled as real	Closed	That panel is gone — Warm-up shows the real health/funnel data instead
Blocks	Agents page renders blank — data loads, the page never shows it	Closed today	Found the real cause: the entrance animation re-ran on every 3-second poll and could get caught mid-teardown with the page stuck at opacity 0. It now plays once per visit, not once per poll — confirmed live across four poll cycles with nothing going invisible
Slows	Connecting an account means opening DevTools and copying raw cookies	Still open	Needs a real LinkedIn login flow, which is a product/API decision, not a page I can fix from the frontend — flagged for Hemang, not silently dropped
Slows	No screen shows the people actually imported for a target profile	Still open	Needs a backend endpoint that counts/lists imported people per profile; nothing to wire the frontend to yet
Looks bad	Agents and Campaigns are a different app behind the same menu bar	Closed today	Re-themed both to the same dark/purple tokens as the rest of the app, and added Campaigns to the menu — it was a real page with no way in before today

Sev	Finding	Status	Note
Looks bad	Phone menu loses its labels and the account name disappears	Closed today	Labels never hide now; the menu scrolls sideways with a fade hint instead. The account name gets first claim on its row so the mode label can't crowd it out anymore

Seven closed, two open with a named reason. That's the whole list — nothing from Aug 26 is unaccounted for.

What closing the two look-bad items actually looks like

Agents used to be a white, generic-blue page reached from the menu; Campaigns was the same look and wasn't in the menu at all. Both are the same dark/purple product now, and both are one tap away.

Agents (left) and Campaigns (right) at 540px, re-themed and reachable from the menu.

The phone menu at 540px: every label stays on screen instead of dropping to icons, and a fade on both edges hints there's more to scroll to — Accounts, Campaigns, Agents and Account are one swipe away, not hidden with no clue they exist.

Same nav, scrolled from the start (left) to the end (right) — nothing is unreachable.

The account name fix, stress-tested

The bug: with a long account name, the name used to lose a flexbox fight with the 'outreach' mode label and shrink to nothing, leaving just a dot and the word 'outreach' — no way to tell which account. I tested the fix in isolation with a deliberately long name at 360px, narrower than either width in today's brief:

The full name wraps to a second line and stays completely visible; the mode label drops below instead of crowding it out.

The Agents page bug, confirmed fixed live

I left the page open through four 3-second poll cycles — well past the window the old bug needed to strike — and screenshotted it. Everything is still visible; nothing went invisible.

Agents page, ~10 seconds after load, after several data polls.

Keyboard focus, tabbed to with a real keyboard

Two real Tab presses land here — the purple ring is the same global focus style every interactive element in the app now gets.

What I added on top of the audit

Responsive pass at 860px and 540px. Checked every page in the menu at both widths, plus the Campaigns wizard's four steps. There are no data tables in this app to wrap — the equivalent (stat grids, action cards, the priority picker) all collapse to fewer columns instead of squeezing three across at 540px. Touch targets on the primary actions (Approve, Skip, Never contact, its confirm/cancel pair, the queue tabs, the nav) are now a minimum 44px tall on phone widths and shrink back to their compact desktop size at 640px and up — verified by measuring the rendered buttons, not just reading the CSS.

Keyboard and focus states everywhere. The purple focus ring was already global; I went through every onClick in the app looking for one that wasn't a real button, link, or input. Found one — the Campaign card was a clickable div with no keyboard path in — and gave it role="button", tabIndex, and an Enter/Space handler. Everything else was already a real interactive element.

Loading and transition polish, reduced motion respected. Added MotionConfig with reducedMotion="user" at the app root, which is Framer Motion's own supported way to make every whileHover/whileTap/entrance animation in the app snap straight to its end state when the OS says reduce motion — not play shorter, just not play. That covers every page. It doesn't reach the two pages that animate with GSAP directly (Agents, Campaigns), so those check prefers-reduced-motion by hand and skip their entrance/pulse animations outright. A global CSS rule backs both up for plain CSS transitions and turns off smooth-scroll. Loading spinners were left alone on purpose — they're status, not decoration, and a frozen spinner reads as broken.

Method: ran the real app on my own machine (Vite dev server + a local SQLite backend with the dev auth bypass, not mocked), clicked through every page at both widths, tabbed through with a real keyboard, and left the Agents page open across multiple live data polls to confirm the fix actually holds over time rather than just on first paint. Two items — the DevTools login and the imported-people list — need backend work or a product call I don't have today; everything else on the Aug 26 list is closed.
